

QMMF-Net

Quality-conditioned masked moment fusion for MRI segmentation

IMPLEMENTED ARCHITECTURE • 2.5D context • 1,221,465 parameters • source-verified tensor shapes

A Four-scale segmentation network

Shared encoder weights across T1, T1ce, T2 and FLAIR; fusion occurs independently at every scale.

B Fusion module at one encoder scale

GAP drives the weights; all statistics use the unpooled feature tensors F .

C Teacher-student training

Training crop shapes: $H = W = 192$; inference retains the full brain field of view. Solid: prediction path. Dashed: training only.
